-!- SUBUNIT: May homomultimerize via its SAM domain. Interacts with SPTAN1, Homer-1 and DLGAP1/GKAP. Is part of a complex with DLG4/PSD-95 and DLGAP1/GKAP. Interacts with SSTR2 C-terminus via the PDZ domain (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic; postsynaptic density of neuronal cells. Colocalizes with alpha-latrotoxin receptor 1.

-!- ALTERNATIVE PRODUCTS: At least 5 isoforms; 1, (shown here); 2, 3, 4/a and 5; are produced by alternative splicing.

-!- TISSUE SPECIFICITY: Expressed only in brain (neuropil of cortex, CAl region hippocampus and molecular layer of cerebellum).

--- DEVELOPMENTAL STAGE: Expression increases from low levels at birth to high levels at 3-4 weeks before dropping slightly in adulthood. Expressed in the cortex and the molecular layer of the cerebellum at postnatal day 7. Isoform 2 expression does not change during development of both cortex and cerebellum. Isoform 4 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sheng M.,

May play a role in the structural and functional organization of the dendritic spine and synaptic junction. Overexpression promotes maturation of dendritic spines and the enlargement of spine heads via its ability to recruit Homer to postsynaptic sites, and

                                                                                                                                                                                                        FUNCTION: ESSENTIAL PRE-MRNA SPLICING FACTOR REQUIRED EARLY IN SPLICEOSOME FORMATION. BINDS TO THE MANMALIAN POLYPYRIMIDINE TRACTS. FORMS A COMPLEX WITH THE POLYPYRIMIDINE TRACT-BINDING PROTEIN (PTB). SEEMS TO ALSO BIND DNA.

SUBGUNIT: HETEROTETRAMER OF TWO 52 KDA AND TWO 100 KDA SUBUNITS SUBGULILAR LOCATION: NUCLEAR:
ALTERNATIVE PRODUCTS: AT LEAST 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING. SIMILARITY: CONTAINS 2 RNA RECOGNITION MOTIFS (RRW).
CAUTION: WAS ORIGINALLY (REF. 2) THOUGHT TO BE MYOBLAST CELL SURFACE ANTIGEN 24.1D5 AND A POSSIBLE MEMBRANE-BOUND PROTEIN ECTOKINASE.
                                                                                                                                                                   605199;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dev. 7:393-406(1993).

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' GAGAGAGAGAGATCCAAGAGCTCTTTTTTTTTTTTTTTVN 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper Second strand cDNA was prepared with the primer adapter of sequence [5' GAGAGAGATTCTCGAGTTAATTAAATTCACCCCCCCCC 3']. cDNA was cleaved with BamHI and XhoI. cDNA of size comprised longer than 7 kb was selected before cloning. Vector: a modified pBluescript KS(+) after bulk excision from Lambda FLC I. Cloning sites, 5' end: SalI; 3' end: BamHI Host. DNAO

                                                                                                                                                                                                                                                                                                                                               cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' GAGAGAGAGGATCCAAGAGCTCTTTTTTTTTTTTTTTTVN 3'], cDNA was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (10-JUL-2000) Yoshihide Hayashizaki, The Institute of Physical and Chemical Research (RIKEN), Laboratory for Genome Exploration Research Group, RIKEN Gemomic Sciences Center (GSC), RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokoham Kanagawa 230-0045, Japan (E-mail:genome-res@gsc.riken.go.jp, URL:http://genome.gsc.riken.go.jp/, Tel:81-45-503-9222, Pax:81-45-503-9216)
                                                                                         prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 10.0 and subtraction to Rot = 10.0. Second strand cDNA was prepared with the primer adapter of sequence [5]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hayashizaki,Y.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; NCI CGAP EDI is a normalized cDNA library containing the following tissue(s): Chondrosarcoma cell line CSS. The library was constructed according to Bonaldo Lennon and Soares, Genome Research, 6:791-806, 1996.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rag_LIB=UI-H-ED1
